

LOGIC MODULE INSTALLATION INSTRUCTIONS

The purpose of the Logic Module is to allow the installation of a 3rd brake light. The module takes the signal from the tail lights and filters out the turn signals, therefore illuminating the 3rd brake light only when the vehicles brakes are applied.

*Does not work with L.E.D. Running/Brake taillights.

20-702 DIODE INSTRUCTIONS

When using Pacer Logic Module 20-702 on newer vehicles with CANBUS systems, there can be reference voltage left on the signal wires that prevent proper operation. The supplied diodes will cancel out this signal and allow the module to still operate properly when installed properly on the two YELLOW input wires.

There is a dark line on each diode body that must be facing the logic module when soldered in line for the input wires. If the diode is installed backwards, it will not properly filter the signal and can allow the light to flash when a turn signal is activated.
